

1. Internal knowledge-base assistant built from documents

Project

A company ChatGPT-style assistant for internal policies, contract templates, product descriptions, process documentation, HR materials and proposal templates.

Specific solution

The company's existing documents - Google Drive, SharePoint, PDFs, Word files and internal wikis - are indexed, and a RAG-based assistant answers employees' questions with source references. The essence of RAG is that the language model does not answer from memory: it retrieves relevant internal documents and generates its answer based on them.

Example questions

- What is the company's warranty procedure for B2B customers?
- What discount can be offered on a proposal above HUF 50 million?
- Where is the 2025 bonus policy?

Why is it easy to implement?

There is no need to rewrite the core ERP. Document access, permission logic, a search index and a controlled chatbot interface are enough.

Measurable results

- fewer internal questions for HR, legal and finance teams;
- shorter onboarding time;
- less time spent searching for documents.

First pilot

4-6 weeks, with one department.
